Counting Clocks

Jojo, as curious as he is, really likes to count how many rotation it can be made by his newly custom-made clock. At first, he will set how much degree can the clock made in a split second. After that, he will set how long will the clock rotate. Given that Jojo itself is quite bad at math, you as the programmer were given a task to help him figure out how many rotation it could make

Format Input

The input composed of two lines.
The first line consists of a single line T. T will always be 3.
The second line consists of two float number A, B. A is the number of degree made in a single second and B is the total number of second passed since the first time it had turned on.

Format Output

Output a single float number with 2 precision point – the number of rotation it has made.
Note that a full rotation is made when the clock goes 360 degree

Constraints

$1 \leq A \leq 360$

$1 \leq B \leq 2^{60}$

Sample Input	Sample Output
3 60 60 11 100000 7 100000	10.00 3055.56 1944.44
